## Question 1

(a)

Since  $\mathbf{x} \in \mathbb{R}^m$ , let  $\mathbf{q}_1 = \frac{\mathbf{x}_1}{\|\mathbf{x}_1\|_2}$ . Because  $\mathbf{x}$  is a vector, it only has one column, the matrix  $\mathbf{Q}$  is just  $\mathbf{q}_1$ . For  $\mathbf{R}$ , since there is only one column,  $\mathbf{R} = \mathbf{r}_{11} = \|\mathbf{x}_1\|_2$ . The QR decomposition will be

$$\mathbf{x} = \mathbf{Q}\mathbf{R} = \frac{\mathbf{x}_1}{\|\mathbf{x}_1\|_2} \cdot \|\mathbf{x}_1\|_2$$

(b)

Given an orthogonal matrix  $\mathbf{J} \in \mathbb{R}^{m \times n}$ . Let  $\mathbf{q}_1 = \frac{\mathbf{j}_1}{\|\mathbf{j}_1\|_2}$ , and  $\mathbf{q}_2$  is,

$$\mathbf{q}_2 = \frac{\mathbf{j}_2 - (\mathbf{q}_1^\top \mathbf{j}_2) \mathbf{q}_1}{\|\mathbf{j}_2 - (\mathbf{q}_1^\top \mathbf{j}_2) \mathbf{q}_1\|_2}$$

Since  $\mathbf{J}$  is an orthogonal matrix,  $\mathbf{q}_1 \cdot \mathbf{j}_2 = 0$ , indicating

$$\mathbf{q}_2 = \frac{\mathbf{j}_2}{\|\mathbf{j}_2\|_2}$$

This case can be generalized into any column  $\mathbf{q}_i$  for matrix  $\mathbf{Q}$ . For matrix  $\mathbf{R}$ ,  $\mathbf{r}_{ij} = \mathbf{q}_i^\top \mathbf{j}_j$ . In this case, since  $\mathbf{Q}$  is an orthonormal matrix to  $\mathbf{J}$ ,  $\mathbf{r}_{ij} = 0 \forall i, j \leq m, n$ . And for diagonal entries

$$\mathbf{r}_{jj} = \|\mathbf{j}_j - \sum_{i=1}^{j-1} \mathbf{r}_{ij} \mathbf{q}_i\|_2$$

Where  $\sum_{i=1}^{j-1} \mathbf{r}_{ij} \mathbf{q}_i = 0$  because  $\mathbf{r}_{ij} = 0$ . Therefore,  $\mathbf{r}_{jj} = \|\mathbf{j}_j\|_2$ .

Overall, after doing QR decomposition on an orthogonal matrix, we get  $\mathbf{Q}$  is an orthonormal matrix and each column is the normal vector from  $\mathbf{J}$ .  $\mathbf{R}$  is a diagonal matrix with each entry represents the 2-norm of the corresponding column vector in  $\mathbf{J}$ .

(c)

Given an upper triangular matrix  $\mathbf{T} \in \mathbb{R}^{m \times n}$  Let  $\mathbf{q}_1 = \frac{\mathbf{t}_1}{\|\mathbf{t}_1\|_2}$ , which is just  $\mathbf{e}_1$  in this case. For  $\mathbf{q}_2$ , it should be

$$\mathbf{q}_2 = \frac{\mathbf{t}_2 - (\mathbf{q}_1^\top \mathbf{t}_2) \mathbf{q}_1}{\|\mathbf{t}_2 - (\mathbf{q}_1^\top \mathbf{t}_2) \mathbf{q}_1\|_2}$$

$$\mathbf{q}_2 = \frac{\begin{bmatrix} 0 \\ \mathbf{t}_2 \mathbf{2} \\ \vdots \\ 0 \end{bmatrix}}{\left\| \begin{bmatrix} 0 \\ \mathbf{t}_2 \mathbf{2} \\ \vdots \\ 0 \end{bmatrix} \right\|_2}$$

which is just  $\mathbf{e}_2$ . We can then general all column  $\mathbf{q}_i$  in matrix  $\mathbf{Q}$  as  $\mathbf{e}_i$ . Therefore,  $\mathbf{Q}$  is just an identity matrix with dimension  $m \times m$ .

Based on the informaiton that  $\mathbf{Q}$  is an identity matrix, we can then just get  $\mathbf{R}$  which  $\mathbf{R}$  is just the original matrix since a matrix times an identity matrix will still be itself.

$$\mathbf{T} = \mathbf{QR} = \mathbf{IT}$$

## Question 2

$$\text{Let } \mathbf{u}_1 = \mathbf{a}_1 + \|\mathbf{a}_1\|_2 \mathbf{e}_1 = \begin{bmatrix} 4 \\ 2 \\ -2 \\ 1 \end{bmatrix} + 5 \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 9 \\ 2 \\ -2 \\ 1 \end{bmatrix}.$$

$$\text{new } \mathbf{a}_1 = \begin{bmatrix} 4 \\ 2 \\ -2 \\ 1 \end{bmatrix} - 2 \frac{45}{90} \begin{bmatrix} 9 \\ 2 \\ -2 \\ 1 \end{bmatrix} = \begin{bmatrix} -5 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\text{new } \mathbf{a}_2 = \begin{bmatrix} -3 \\ -14 \\ 14 \\ -7 \end{bmatrix} - 2 \frac{-90}{90} \begin{bmatrix} 9 \\ 2 \\ -2 \\ 1 \end{bmatrix} = \begin{bmatrix} 15 \\ -10 \\ 10 \\ -5 \end{bmatrix}, \text{ which is } \begin{bmatrix} -10 \\ 10 \\ -5 \end{bmatrix}$$

$$\text{new } \mathbf{a}_3 = \begin{bmatrix} 4 \\ -3 \\ 0 \\ 15 \end{bmatrix} - 2 \frac{45}{90} \begin{bmatrix} 9 \\ 2 \\ -2 \\ 1 \end{bmatrix} = \begin{bmatrix} -5 \\ -5 \\ 2 \\ 14 \end{bmatrix}, \text{ which is } \begin{bmatrix} -5 \\ 2 \\ 14 \end{bmatrix}.$$

$$\text{Similar, } \mathbf{u}_2 = \mathbf{a}_2 - \|\mathbf{a}_2\|_2 \mathbf{e}_1 = \begin{bmatrix} -10 \\ 10 \\ -5 \end{bmatrix} - 15 \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} -25 \\ 10 \\ -5 \end{bmatrix}$$

$$\text{new } \mathbf{a}_2 = \begin{bmatrix} -10 \\ 10 \\ -5 \end{bmatrix} - 2 \frac{375}{750} \cdot \begin{bmatrix} -25 \\ 10 \\ -5 \end{bmatrix} = \begin{bmatrix} 15 \\ 0 \\ 0 \end{bmatrix}.$$

$$\text{new } \mathbf{a}_3 = \begin{bmatrix} -5 \\ 2 \\ 14 \end{bmatrix} - 2 \frac{75}{750} \cdot \begin{bmatrix} -25 \\ 10 \\ -5 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 15 \end{bmatrix}, \text{ which is } \begin{bmatrix} 0 \\ 15 \end{bmatrix}.$$

$$\mathbf{u}_3 = \mathbf{a}_3 + \|\mathbf{a}_3\|_2 \mathbf{e}_1 = \begin{bmatrix} 0 \\ 15 \end{bmatrix} + 15 \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 15 \\ 15 \end{bmatrix}$$

$$\text{new } \mathbf{a}_3 = \begin{bmatrix} 0 \\ 15 \end{bmatrix} - 2 \frac{225}{450} \cdot \begin{bmatrix} 15 \\ 15 \end{bmatrix} = \begin{bmatrix} -15 \\ 0 \end{bmatrix}, \text{ therefore, we can get } \mathbf{R}$$

$$\begin{bmatrix} -5 & 15 & -5 \\ 0 & 15 & 0 \\ 0 & 0 & -15 \\ 0 & 0 & 0 \end{bmatrix}$$

### Question 3

$$\text{Given } \mathbf{A}^\dagger = (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top,$$

(a)

The left side can be transformed into:

$$\begin{aligned} \mathbf{A} \mathbf{A}^\dagger \mathbf{A} &= \mathbf{A} (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{A} \\ &= \mathbf{A} \mathbf{A}^{-1} (\mathbf{A}^\top)^{-1} \mathbf{A}^\top \mathbf{A} \end{aligned}$$

Since  $\mathbf{A} \mathbf{A}^{-1} = \mathbf{I}$  and  $(\mathbf{A}^\top)^{-1} \mathbf{A}^\top = \mathbf{I}$ ,

$$\mathbf{A} \mathbf{A}^\dagger \mathbf{A} = \mathbf{I} \mathbf{A} = \mathbf{A}$$

■

(b)

The left side,

$$\begin{aligned}\mathbf{A}^\dagger \mathbf{A} \mathbf{A}^\dagger &= \mathbf{A}^\dagger \mathbf{A} (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \\ &= \mathbf{A}^\dagger \mathbf{A} \mathbf{A}^{-1} (\mathbf{A}^\top)^{-1} \mathbf{A}^\top\end{aligned}$$

Since  $\mathbf{A} \mathbf{A}^{-1} = \mathbf{I}$  and  $(\mathbf{A}^\top)^{-1} \mathbf{A}^\top = \mathbf{I}$ .

$$\mathbf{A}^\dagger \mathbf{A} \mathbf{A}^\dagger = \mathbf{A}^\dagger$$

■

(c)

Left side is,

$$\begin{aligned}(\mathbf{A} \mathbf{A}^\dagger)^\top &= ((\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top)^\top \mathbf{A}^\top \\ &= \mathbf{A} ((\mathbf{A}^\top \mathbf{A})^{-1})^\top \mathbf{A}^\top \\ &= \mathbf{A} ((\mathbf{A}^\top \mathbf{A})^\top)^{-1} \mathbf{A}^\top \\ &= \mathbf{A} (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \\ &= \mathbf{A} \mathbf{A}^\dagger\end{aligned}$$

■
